

Ultimate 3000™

ULTIMATE 3000™ Feature Handset and Software

INTELLIGENT FEATURE PHONE

3000/DH FEATURE PHONE HANDSET

- Manufactured in a tough UPVC with LCD display
- Fully functional telephone keypad for dialling residents or entrance panels
- Hands free and conventional handset for audio communication
- Calls from intercom panels can be placed on hold and/or transferred
- Bluetooth headset option
- Choice of simplex (push to talk, release to listen) duplex audio facility or hands free
- Auxiliary lock/gate/barrier control button
- Selectable ringtone annunciation for various functions
- Programmable ID text for each exchange line (32 character LCD display)
- Patch PBX line to chosen intercom extension
- 4 Status indicators for the following functionality:
 - Call in queue
 - PBX exchange line in queue
 - More than one call in queue
 - Call on hold
 - Feature phone in use
- Optional connection to PBX exchange via 3000/TEL telephone exchange card. The feature handset then becomes an extension to the building telephone exchange, thus enabling calls from an extension or from the national network to be received on the feature handset. These calls can also be transferred to the other audio instruments.

3000/U PROGRAMMING TOOLS

● The Ultimate 3000™ system is an intelligent solution as each exchange can be programmed individually for the buildings specific requirements, including multiple main entrances and sub landing systems etc offering an extremely versatile system. The exchange is supplied with a default database (0-95, 0 = main entrance panel and all other numbers representing sequential numbers for flats 1-95). These numbers can then be edited if required for buildings with numbers that are not within this sequence using the tools programme.

For multiple exchanges and buildings that may be standalone or on concierge networks, the installer can configure the systems from a Laptop PC.

● ISM also offers a service for programming system hardware in our factory, or alternatively, we can configure databases and forward them by CD or Email which may then be downloaded to the site hardware using the tools programme. This facility is available at an additional cost for each building.

GENESYS™ INTEGRATED SOFTWARE

Ultimate 3000™ can be connected to the Genesys™ Physical Security Information Management (PSIM) software which offers not just intercom and alarm management functionality (via 3000/MIO) but full access to integration to CCTV, digital recording, fire, intruder alarms, paging etc. The Genesys™ software offers full IP networking capabilities of the Ultimate 3000™ audio and data hardware, thereby providing an extremely unique and flexible solution for those clients that wish to control their building security either locally or via their central control suite over a LAN or WAN.

An Ultimate 3000™ feature handset is provided at each workstation allowing the operator to communicate with visitors and the security staff. The handset can also be used as a self contained intercom system for the smaller sites without the need for the software based solution. The feature phone handset is an intelligent unit with a 2 line LCD text display. Each handset displays the apartment number, door entrance panel or intercom location (ideal for single apartment blocks and warden controlled systems).

The Ultimate 3000™ intercom module has all of the functionality of the feature handset via a touch screen. This may also include graphical location of buildings and active animated icons denoting the intercom status as well as alarms, doors, barriers etc and text screens displaying call queues which includes details of location and on screen video for intercoms with video cameras.

For full information on the concierge software, please refer to the Genesys™ brochure.

For full information on the Genesys™ PSIM software, please refer to the Genesys™ brochure.

For a full overview of the Ultimate 3000™ products, please refer to main brochure.
